Abstract:

This invention provides an automatically centralized remote monitoring system. In the invention, microcomputer is used to monitor and control respectively, via multichannel bus, the multiple functions of a large number of field stations linked to the bus. The system consists of microcomputer, communication line, branch microcomputers and sensors at field stations, and executing mechanism. The microcomputer at central station can acquire the output signals of various sensors at various field stations (such as military depot, bank, etc.) at certain distance and order various executing mechanisms (for example, camera, electronic lock, etc.) to work according to predetermined program. The system has such advantages as high response speed, larger area to be guarded, long transmission distance, high reliability, low cost, and low false message and missed message rates.
